ErgoHack VI Proposal

About

Lilium is a decentralized NFT sale platform for Ergo blockchain. We aim to be an infrastructure service for any business seeking an easy way to mint and distribute tokens, integrating seamlessly within their products and applications.

Our initial MVP will be aimed at artists interested in large-scale NFT sales (collections). The purpose of developing a decentralized system for executing sales is to alleviate any worries about the long-term maintenance of the sale. In the worst case, the artists themself could run the sale using the automated bot we are developing.

Goals

Our goals for developing our MVP during ErgoHack VI will be the following:

1. Produce the ErgoScript contracts for the prototype
2. Write the off-chain code for our decentralized sales bot
3. Basic front-end for user interaction (if time permits)
4. Demo (if time permits)
