~ERGONAMES

This DeFi project creates easy to remember Ergo Names for your Ergo wallets.

We plan to use ErgoHack V as an opportunity to fast-track our development and to solve for a few crucial roadmap items.

Table 1: Our Goals in ErgoHack V

#	Task	Area	Description	Priority
T1	Multi Contract Approach	Backend	To ensure that minting address of all ergo names is consistent, we are experimenting with a multi contract approach where one contract accepts user orders and then forwards the request to second contract for minting.	★★★★★
T2	Orphan Request Management	Backend	An approach to reliably solve for failed minting attempts in all edge cases.	★★★★
T3	NSFW Engine	Backend	A backend service which ensures that the ergo name is 'safe'	★★★
T4	Decouple from Explorer	Backend	Some of the backend services rely on explorer. We want to decouple this dependency to reach true decentralisation.	★★
T5	Temporary Block	Backend	A service to temporarily block ergo name while minting requested has been initiated by 1 user.	★
